Test Name	Results	Units	Bio. Ref. Interval
IMMUNOGLOBULIN IgG SUBCLASS 4 (IgG4),SERUM (Nephelometry)	123.00	g/L	0.03 - 2.01

Notes

- Elevated levels of IgG4 are consistent with, but not diagnostic of, IgG4-related disease. The diagnosis of IgG4-related disease requires a tissue biopsy of the affected organ.
- Elevations in serum IgG4 concentrations are not specific to IgG4-related disease; they are also found in disorders such as multicentric Castleman disease, allergic disorders, Churg-Strauss syndrome, sarcoidosis, and a large number of other conditions

Comments

IgG immunoglobulins are comprised of 4 subclasses designated IgG1 through IgG4. Of total IgG, approximately 65% is IgG1, 25% is IgG2, 6% is IgG3, and 4% is IgG4. IgG subclass 4-related disease is a recently recognized syndrome of unknown etiology most often occurring in middle-aged and older men. Several organ systems can be involved and encompasses many previous and newly described diseases such as type1 autoimmune pancreatitis; Mikulicz disease and sclerosing sialadenitis; inflammatory orbital psuedotumor; chronic sclerosing aortitis; Riedel thyroiditis, a subset of Hashimoto thyroiditis; IgG4-related interstitial pneumonitis; and IgG4-related tubulointerstitial nephritis. Elevated serum concentrations of IgG4 are found in 60% to 70% of patients diagnosed with IgG4-related disease.
