European Society for Pediatric Gastroenterology, Hepatology and Nutrition (ESPGHAN) GUIDELINES on diagnosing children and adolescents with CD For initial testing, the combination of total IgA and IgA class antibodies against transglutaminase 2 (TGA-IgA) is recommended as this is most accurate and cost-effective. EMA-IgA or DGP-IgG need not be tested initially However, a no-biopsy approach is appropriate for children with TGA-IgA values ≥ 10 times the upper limit of normal with appropriate tests and positive endomysial antibodies (EMA-IgA) in a second serum sample. Children with positive TGA-IgA but lower titers (<10 times upper limit of normal) should undergo biopsies to decrease the risk of false positive diagnosis Patients with positive TGA-IgA and EMA and no or minor small bowel histological changes are usually diagnosed as having 'potential' CD
